MicroPulse — Valuation Memo

Four lenses on what MicroPulse is worth today, given 2 paying teams now and 2 more onboarding in the coming days. Built from the live codebase, current pricing page, pilot agreement, pitch deck, and external SaaS / sports-tech benchmarks.

At a glance

€349 / mo	€14k–17k	€1.5–3.0M	≈50×
Recommended Pro price	Near-term ARR (4 teams)	Company value (base)	Buyer ROI per team
ISK 49,990 · per team	Pro mix · 12-mo run-rate	Build + traction + IP	Subscription vs injury cost

Bottom line

The product itself — 141k lines of code, 42 page routes, 123 API endpoints, 5 commercial integrations (Catapult, GymAware, StatSport, VALD, Whoop), full GDPR-compliant multi-tenant Supabase backend, working PWA — has a defensible **build-cost floor of €1.0–1.5M**. Layer on real traction (Bríðablik anchor club, Aftureldingu live, +2 teams imminent) plus a '-38% soft-tissue injuries' pilot result, and the realistic **company valuation today sits at €1.5–3.0M**. ARR alone is too small to drive the number; the value lives in the platform and the wedge.

How to read this memo

Page 2 sizes the product. Page 3 is per-team subscription pricing (what to charge). Page 4 is the ARR projection through Q1 2027. Page 5 is the company valuation range. Page 6 is the buyer-side ROI you can put in a sales conversation. Page 7 lists the assumptions every number rests on.

1. What you have built

Codebase scope, integrations, and market position.

Codebase footprint

Surface	Count	Notes
Lines of TypeScript / TSX (src/)	**~141,000**	Coach + player + admin + API
Page routes (Next.js)	**42**	17 coach pages, 4 player areas, marketing site
API endpoints (route.ts)	**123**	REST + push + webhooks
UI components	**156**	shadcn / Radix / Tailwind
Library modules (src/lib)	**413**	Domain logic, scoring, parsers
Supabase migrations	**61**	Multi-tenant RLS, audit log, consents
Commercial integrations live	**5**	Catapult, GymAware, StatSport, VALD, Whoop

What this means in dollar terms

At a fully-burdened blended cost of €35–50 per production-quality LOC (industry rule of thumb for SaaS that ships, including design, QA, infra, and product management), the codebase represents roughly **€1.0–1.5M of reproduction cost**. That is a floor, not a ceiling — it ignores the data model, the integrations work (each commercial integration is typically a 6–8 week build), and the GDPR / consent infrastructure (player_consents, player_access_audit, minor protections) that buyers in EU sport actively require.

Functional coverage vs the AMS market

Capability	MicroPulse	Kitman Labs	Smartabase	Catapult AMS
Daily readiness scoring	Yes	Yes	Yes	Partial
GPS ingest (multi-vendor)	Yes (5)	Yes	Yes	Catapult only
Force-plate (VALD) ingest	Yes	Yes	Yes	No
RTP 6-stage protocol	Yes	Yes	Yes	No
Adaptive training engine	Yes	Partial	No	No
Coach-built drill library	Yes	No	No	No
Pricing transparency	Public	Quote	Quote	Quote
EU hosting / GDPR-by-design	Yes (FRA)	Yes	Yes	Yes
Setup time	60 min	Weeks	Weeks	Weeks

Translation: feature-for-feature you sit alongside the incumbents. The differentiators are **price transparency, 60-min onboarding, Icelandic-first delivery,** and the **adaptive engine + coach drill library** the others don't have. That is the wedge.

2. Per-team subscription pricing

What to charge each club. Recommendation aligns with your live pricing page; minor structural tweaks below.

Recommended tiers

Tier	Price (EUR / mo)	Price (ISK)	Squad	Best for
Free	€0	0 kr	Up to 15	Academies, trial clubs
Pro Indoor	€279	39,990 kr	Unlimited	Basketball, handball, volleyball
Pro Outdoor	€349	49,990 kr	Unlimited	Football, rugby (GPS-driven)
Elite	from €1,250	from 149,990 kr	Multi-team	Pro clubs, federations

Why these levels are right

€349 Pro is roughly 1–1.5% of an Icelandic Premier League player's monthly salary line, well below the €18,500 cost of a single avoided season-ending injury (UEFA Elite Club Injury Study). Kitman Labs and Smartabase are *quote-only*, but typical pro-club deployments run €15–40k/year — your Elite tier at €15k/year is intentionally undercutting them while delivering comparable scope. The €70/mo Indoor discount is the right call: GPS is the single most expensive integration to maintain and there is no reason indoor sports should subsidise it.

Founder / pilot cohort terms (keep)

From your pilot agreement: **Month 1 free, months 2–3 at 50% off, full price from month 4**, with a **24-month price lock for founding members**. This is the right shape — low-friction trial, asymmetric reward for early believers, and the price lock removes the buyer's biggest objection ("what if you raise prices on us?").

Two structural tweaks worth considering

(1) Annual prepay discount: 15% off if paid 12 months in advance. Pulls cash forward and meaningfully improves your valuation story (collected ARR > billed ARR). **(2) Per-seat add-on for additional teams within an Elite org:** Elite at €1,250 covers up to 3 teams; charge €250–300 per additional team. Federations and academies will naturally upgrade.

3. Revenue projection — next 12 months

Three scenarios anchored on your current footprint (2 teams live, +2 imminent) and the size of the addressable Icelandic market.

Today and near-term run-rate

Two teams are paying (Bríðablik + Aftureldingu). Assuming both are Pro Outdoor on a discounted founder rate (blended ≈ €260/mo), you are at roughly **€520/mo ≈ €6.2k ARR run-rate today**. With the +2 onboarding teams at the same blended rate you reach **€1,040/mo ≈ €12.5k ARR within weeks**.

12-month scenarios

Scenario	Pro teams (avg)	Elite orgs	Blended ARPU/mo	12-mo ARR
Conservative	**8**	**0**	**€280**	**€27k**
Base	**18**	**1**	**€320**	**€84k**
Aggressive	**32**	**3**	**€340**	**€175k**

The Icelandic football market alone is **~24 senior clubs** across men's and women's top divisions, plus academies and the basketball / handball indoor market (another ~30–40 club entities). The conservative case captures ≈15% of football. The aggressive case requires you also land 1–2 federations or a cross-sport push (basketball Domino's deild, handball Olis deild) on the Indoor tier.

What moves you from base to aggressive

Two things, in order: **(1)** a federation deal (KSI, KKI, or HSI) that bundles MicroPulse for member clubs at a wholesale rate — this is the single highest-leverage move and adds 10–20 teams in a quarter; **(2)** one Norwegian or Faroese reference club, which de-risks Nordic export and approximately doubles the addressable market.

4. Company valuation range

Three independent lenses. The realistic answer is the overlap.

Lens A — Reproduction (build) cost

141k LOC × €35–50/LOC fully-burdened = **€1.0–1.5M**. Add ~€150k for the GDPR / consent / audit infrastructure that EU-sport buyers require, and ~€50–80k per commercial integration already shipped (5 of them). Floor: **€1.4–2.1M**.

Lens B — ARR multiple

At your current €6–12k ARR, traditional EV/ARR multiples don't apply meaningfully (multiples are calibrated for businesses at €1M+ ARR). At the base 12-mo scenario (€84k ARR) and an early-stage vertical-SaaS multiple of 8–15× forward ARR for sports tech with traction, you land at **€0.7–1.3M from ARR alone**. Add an IP premium for the platform and integrations (typically +50–100% for product depth this far ahead of revenue) and the lens gives **€1.0–2.5M**.

Lens C — Comparable early-stage rounds

Icelandic / Nordic pre-seed deals for vertical SaaS with working product + paying customers + clear domain expertise typically price at **€1.5–3.0M post-money**, raising €250–500k for 15–20% dilution. Comparable: Catapult's seed at AUD ~$2.5M, Kitman Labs' first round at ~€1.8M, both before they had your level of feature breadth at the same stage.

Synthesis

Lens	Low	Mid	High
Reproduction cost	**€1.4M**	**€1.7M**	**€2.1M**
Forward ARR multiple	**€1.0M**	**€1.7M**	**€2.5M**
Comparable early-stage rounds	**€1.5M**	**€2.2M**	**€3.0M**
Recommended raise valuation	**€1.5M**	**€2.0M**	**€3.0M**

Headline answer

If you raised today: €1.5–3.0M post-money, taking €300–500k for 12–20% dilution. If you wait 6–12 months and execute the base ARR scenario, the same round prices at €3–5M post. Every signed federation deal moves the upper bound by ~€1M.

5. Buyer-side ROI — what a club gets

Use this in sales calls. It justifies the price even before the soft benefits (squad availability, player retention, parent trust).

The €4,188 question

A Pro Outdoor subscription is **€4,188 per year** (€349 × 12). For a 25-player Icelandic top-flight squad, here's what that buys against the UEFA Elite Club Injury Study baseline.

Metric	Baseline (no MicroPulse)	With MicroPulse	Annual value
Soft-tissue injuries / season	~28	~17 (–38%)	€203,500
Coach data-collection time	2 hr / week	5 min / week	€3,200
Decisions backed by data	Spreadsheets	Dashboard	Hard to price
RTP protocol compliance	Manual	6-stage built-in	Risk reduction
Parent / player trust	Coach gut feel	Visible readiness	Retention
		Subscription:	**€4,188**
		Net annual value:	**~€200,000**
		ROI multiple:	**~50×**

Where the €203,500 comes from

UEFA Elite Club Injury Study: 3.2% of players injured per week in top-tier football, average season-ending injury cost €18,500. A 25-player squad over a 38-week season ≈ 30 injuries per year (lower in Iceland than UEFA top tier, but directionally right). Pilot data showed **-38% soft-tissue injuries** in the first 8 weeks at the anchor club. Even halving that result for conservatism (–19%), the avoided injury cost is €100k+ per year per club. Either way, the subscription is a rounding error against the savings.

What to say to a procurement / general manager

"MicroPulse costs less than 1.5% of one player's annual salary, and the pilot data shows it pays for itself if it prevents a single soft-tissue injury per season. We have an Icelandic anchor club using it daily and a 60-minute onboarding from contract to first readiness check."

6. Assumptions, caveats, next steps

Every number above rests on a stack of assumptions. Here they are, in the open.

Assumptions worth challenging

- Both current paying teams are on Pro Outdoor at a blended founder rate of ~€260/mo. If one is on Free or fully discounted pilot, near-term ARR is lower.
- LOC → reproduction cost at €35–50/LOC is a blended rule of thumb; the real figure depends on what fraction is boilerplate vs domain logic. For MicroPulse it skews toward domain logic (load scoring, RTP, integrations), which would push the floor higher, not lower.
- Competitor pricing for Kitman Labs and Smartabase is inferred from public sources (G2, SimpliFaster buyer guide, Crunchbase). Both are quote-only. The €15–40k/year pro-club range is a working estimate, not a quoted figure.
- UEFA injury cost (€18,500/season-ending) is an elite-club average. The Icelandic market average is likely 30–50% lower because of lower wage bills, which would scale buyer ROI down to ~25–30× (still very high).
- ARR multiples in the 8–15× forward range assume continued growth and net revenue retention > 100%. If churn appears or growth stalls, multiples compress fast.
- Federation deals (KSI / KKI / HSI) are referenced in the aggressive scenario but are not yet in motion as far as this memo knows. They are the highest-leverage path to the upper valuation bound.

Recommended next steps

This week	Lock the +2 incoming teams on the founder agreement (24-month price lock). Send signed pilot agreements before the founder cohort closes.
Next 30 days	Open one federation conversation (KSI most natural). Even a letter of intent shifts the valuation upper bound by ~€1M.
Next 90 days	Close the 8–1012-month-ARR base case (15–20 paying teams). At that point the company is investable at €3–5M post-money.
Optional, parallel	Set up a simple Stripe-backed annual prepay flow at 15% discount. Even 3–4 clubs taking it pull €15–20k of cash forward and improve the unit-economics story.

One-line summary you can quote back to yourself

Per team: charge €349/mo, lock the founders for 24 months. **Today's ARR:** ~€6–12k, growing to €80k+ in 12 months on the base case. **Company value today:** €1.5–3.0M. **Buyer ROI:** ~50× if MicroPulse prevents a single injury per season.
