

Building Your Training Program

A 2-page quick start for strength coaches using the MicroPulse Coach Dashboard.

Where to start

Sign in to the Coach Dashboard and open **Coach** → **Custom templates** (*Mitt æfingakerfi*). Click **+ Create new system** to launch the 4-step builder.

The builder, in four steps

Each program is built per team, per season phase. The builder walks you through team selection, the match-day slots you want to cover, the GREEN (full-readiness) workout for each day, and a final review.

1

Team & season phase

Pick the team you are programming for (auto-filled if you only coach one). Then choose a season phase: **Preseason**, **In-season**, **Playoffs**, or **Off-season**. Sport and gender are inherited from the team.

2

Pick the match-day slots

Select which days you want to define: **GENERIC** (general training day, MD-5 and earlier), **MD-4** → **MD-1** (lead-up to a match), **MD** (match day), and **MD+1** → **MD+3** (recovery and rebuild). Days already saved are flagged so you can edit them safely.

3

Build the GREEN workout

For each selected day, design the full-readiness session. You have three input methods (see page 2). MicroPulse then auto-generates the **YELLOW** (reduced load) and **RED** (regression) variants — you can override either one if you want full control.

4

Review & save

Check the GENERIC + MD-day matrix and the auto-generated YELLOW/RED previews. Save to publish to your team. Athletes see the right session each morning, scaled to their readiness score.

Three ways to fill a day

When you reach Step 3, each day offers three input methods. Mix and match across days — whatever is fastest for you.

1 Describe it in plain language

Open the **Describe the workout** panel and write the session free-form — e.g. “*French Contrast: Back Squat 85% × 3, Depth Jump × 3, VT 0.8 m/s*”. The parser recognises VBT targets, clusters, potentiation, rest periods, and block headings (A, B, C...) and turns them into editable blocks.

2 Upload a file

Drag a file into the **Upload training program** zone, or click to pick one. Supported formats: **Excel** (.xlsx, .xls), **CSV** (.csv), **PDF** (.pdf), and **plain text** (.txt). MicroPulse extracts the text, parses it into blocks, and shows you a preview before you apply it. Great for reusing existing programs from your spreadsheet library or a coach handover PDF.

3 Pick a pre-built structure

Use the **Structure picker** to drop in a research-backed template — Garcia-Ramos, Moreno, Hansen, Iglesias-Soler, Tufano (Standard / CS2 / CS4), Oliver, or one of the *Potentiation Cluster* variants (Acceleration, Top-end Speed, RFD, ...). Pick one and edit the blocks to fit your athletes.

How GREEN, YELLOW and RED work together

You only design **GREEN**. MicroPulse derives **YELLOW** (moderate readiness — reduced volume / intensity) and **RED** (low readiness — regression or recovery work) from your GREEN blocks. Both auto-versions show a live preview; click **Edit** on either card to override and save a custom YELLOW or RED for that day.

Tips

- ✓ Build a separate program per **season phase**. Pre-season volume looks nothing like in-season.
- ✓ Start with **GENERIC** and **MD-2**. They cover the bulk of your weekly hits.
- ✓ Existing days are flagged **In database** or **Will be updated** — nothing is overwritten silently.
- ✓ If a file upload doesn't parse cleanly, paste the same text into the **Describe** box — the smart parser is more forgiving than the file extractor.

Need a hand?

Reach out in the **#micropulse** channel or email support@micropulse.is. Include your team name and the day you're working on so we can jump straight to the right screen.
